Hotel Management Platform

system structure, login flows, role-based menus, and functional requirements

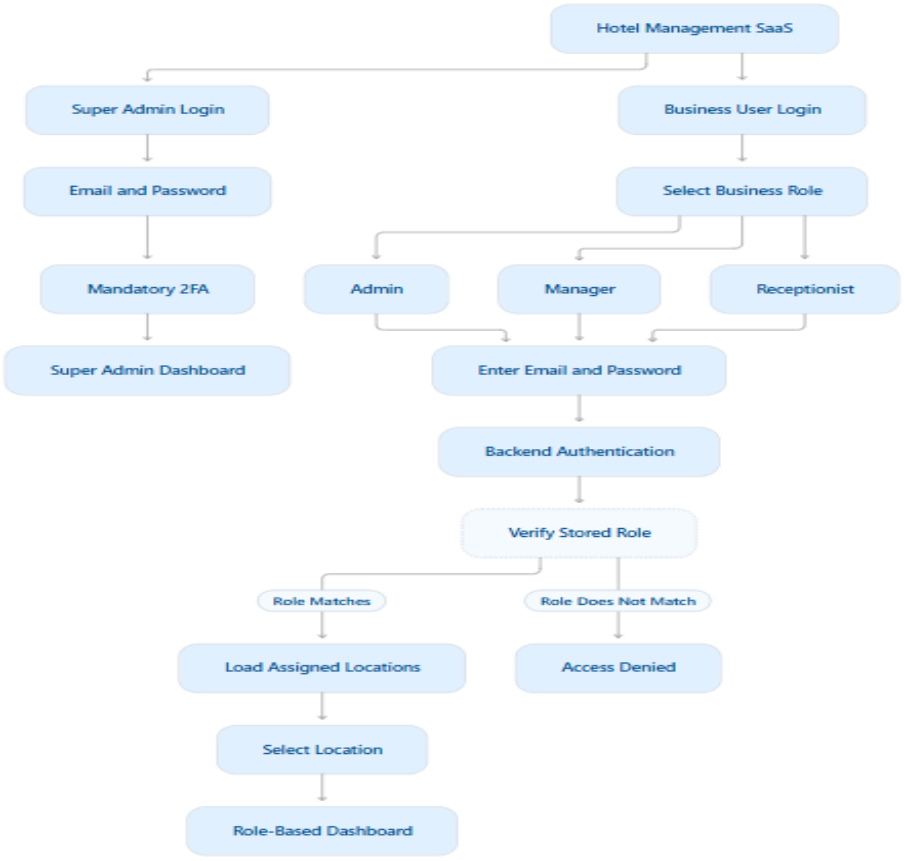

Purpose

A multi-business hotel management platform with a separate Super Admin console and business-user access for Admin, Manager, and Receptionist roles. Each business can manage multiple locations. Business users may access only the locations assigned to their account.

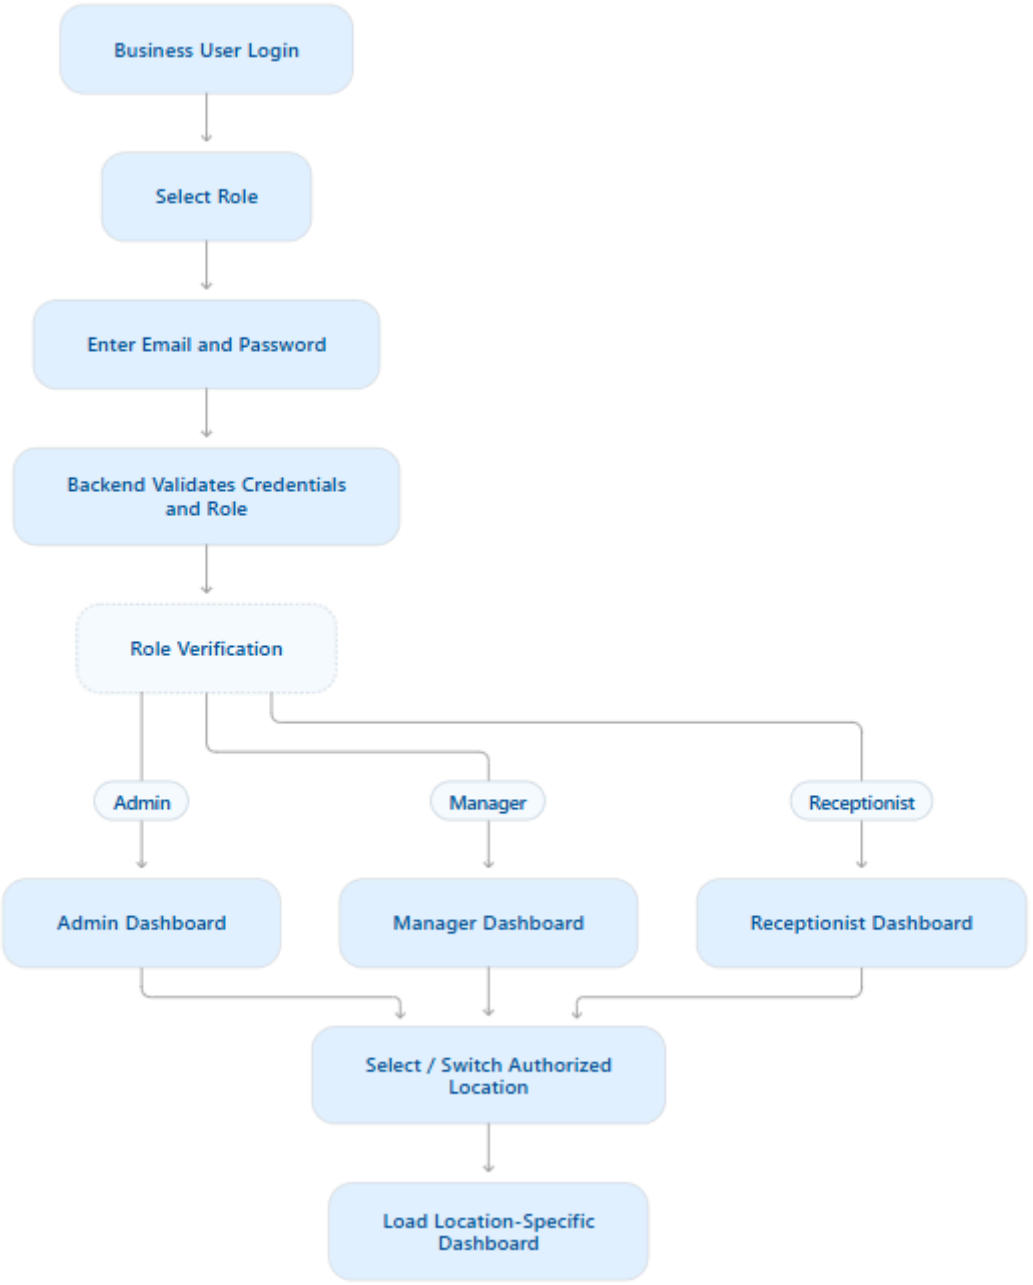

System hierarchy

Platform	Super Admin
Business layer	Business / Hotel 1, Business / Hotel 2, and additional businesses
Location layer	Location 1, Location 2, Location 3, etc. within each business
Property structure	Floors → Rooms;
Business users	Admin, Manager, Receptionist

Login architecture

After business user login

1. Login and Authentication

Super Admin login

- A separate login page for Super Admin: **/super-admin/login**.
- Super Admin authenticates using email and password.
- Successful authentication opens the platform-wide Super Admin dashboard.
- Super Admin can reset business users' passwords.
- Super Admin accounts and sessions are kept separate from business-user accounts and

sessions.

Business-user login

- A separate business-user login page: **domain.com**.
- Before entering credentials, the user selects Admin, Manager, or Receptionist.
- The user enters their registered email and password. The backend verifies the stored role against the selected role.
- Role selection does not grant permissions. A role mismatch is rejected by the backend.
- After successful login, the backend loads the business, fixed role, and assigned locations.
- If the user has one assigned location, open it automatically; if multiple, show a location selector.
- Users can switch between authorized locations without logging in again. The role remains unchanged.
- Users can change passwords.

Business-user login flow

1	Open business-user login and select Admin, Manager, or Receptionist.
2	Enter email and password.
3	Backend authenticates credentials and verifies the selected role against the stored role.
4	Load business status, user status, permissions, and assigned locations.
5	Select an authorized location or automatically open the only assigned location.
6	Open the role-based dashboard with data filtered to the active location.

2. Super Admin Console

Super Admin menu and responsibilities

- Separate login page.
- Platform-wide dashboard and statistics.
- Business / hotel management: create, edit, activate, suspend, and reactivate businesses.
- Business and location management: create and manage locations under each business.
- Floor and room management: manage floors, room types, room details, and room setup.
- Business-user account setup for Admin, Manager, and Receptionist.
- Subscription or plan management where applicable.
- Platform audit logs to track platform activities.
- Platform settings and global configurations.

3. Business User Roles and Menus

Admin

- Dashboard and basic dashboard counts
- Business users
- Business locations
- Floors and rooms
- Room status board
- Calendar view and filters
- Guest details and ID document upload
- Reservation management
- Group reservations and group stays
- Check-in / check-out
- GRC form and GRC number
- Billing, room charges, extra bed, and tax
- Advance payments and payment entries
- Cancellation and refund management
- Housekeeping and cleaner assignment
- WhatsApp messages and feedback links
- Expenses and payouts
- Reports and analytics
- Audit log access as permitted

Manager

- Dashboard and basic dashboard counts
- Room status board and room availability
- Calendar view and filters
- Guest details and ID document upload
- Reservation management and group reservations
- No-double-booking validation visibility
- Check-in / check-out according to assigned permissions
- GRC form and number
- Basic billing, advance payments, and payment entries
- Housekeeping, cleaner assignment, and cleaning status
- Cancellation/refund requests or approvals as configured
- WhatsApp messages and feedback links
- Operational reports
- Audit log access as permitted

Receptionist

- Dashboard and basic dashboard counts
- Room status board and room availability
- Calendar view and filters
- Guest details and ID document upload
- Reservation management
- Group reservations and group stays

- Check-in with GRC form and number
- Guest checkout
- Basic billing: room charges, extra bed, and tax
- Advance payments and payment entries
- Housekeeping requests and cleaner assignment where permitted
- WhatsApp messages and feedback links
- Print GRC and bills
- Cancellation/refund requests according to assigned permissions

4. Functional Requirements

1. Login and authentication

Separate Super Admin login; business-user login with role selection; backend credential and role verification.

2. User roles

Admin, Manager, and Receptionist with fixed roles and server-enforced permissions.

3. Super Admin console

Business and location management; floor and room management; platform dashboard and audit logs.

4. Room status board

View room status and availability by selected location.

5. Basic dashboard counts

Show relevant counts such as rooms, occupied rooms, available rooms, reservations, arrivals, and departures.

6. Calendar view and filters

Calendar-based reservation and stay view with date, status, room, and other applicable filters.

7. Guest details and ID document upload

Maintain guest profiles and upload supported guest identity documents using private storage and authorized access.

8. Reservation management

Create, view, update, and manage reservations.

9. No-double-booking rule

Prevent overlapping active reservations for the same room, including concurrent booking attempts.

10. Check-in

Complete check-in using a Guest Registration Card (GRC) form and unique GRC number.

11. Guest checkout

Complete checkout, finalize stay records, and trigger room cleaning workflow.

12. Basic billing

Calculate room charges, extra-bed charges, and applicable tax.

13. Advance payments and payment entries

Record advances and subsequent payment entries with traceable transaction records.

14. Basic housekeeping

Track housekeeping tasks and cleaning progress.

15. Cleaner assignment and cleaning status

Assign a cleaner or cleaning staff member and track task status.

16. Audit log

Record important user and system actions, including actor, timestamp, action, and affected record where applicable.

17. WhatsApp messages and feedback links

After checkout Send configured WhatsApp messages and feedback links using an approved provider integration .

18. Group reservations and group stays

Support reservations for groups and manage associated stays and guest records.

19. Cancellation and refund management

Track cancellation requests, cancellation status, refund amounts, approvals, and refund/payment status.

5. Core Rules and Security Notes

- Every business user belongs to one business and has one fixed role.
- A user may be assigned to one or more locations within that business.
- Location switching changes operational context, not the user's role or business membership.
- The backend must validate the active location and user assignment on every relevant request. • The client-selected role and location are not trusted as proof of authorization.
- Reservation availability must be protected against concurrent requests and overlapping bookings.
- Guest ID documents should be stored privately and accessed only by authorized users.
- Payment entries and audit records should be traceable; refunds and corrections should preserve history.
- Sensitive operations such as refunds, rate overrides, and cancellation approvals should use permission checks and audit logging.
- WhatsApp integration should use configured credentials and should not expose provider secrets to the frontend.
